Lecture 5b

Overview

- Asymmetric algorithms
- Digital signatures
- Digital certificate
 - What is a digital certificate?
 - Scenario of digital certificate
 - Types of digital certificates
- PKI – Public Key Infrastructure and digital certificate
- Trust
- Certificate Authority
 - What is CA?
 - Intermediate CAs
 - Browsers and CAs
- SSL/TLS protocol and SSL certificate
- Digital envelope
- Stored Data encryption
- Elliptic curve
 - Fundamentals
 - Bitcoin key generation and ECC
 - Tor network and ECC
 - Applications of ECC

Asymmetric Encryption Algorithms

**RSA (Rivest,
Shamir,
Adleman)**

Developed in 1977

Most widely accepted and
implemented approach to
public-key encryption

Block cipher in which the
plaintext and ciphertext are
integers between 0 and $n-1$
for some n .

**Diffie-Hellman
key exchange
algorithm**

Enables two users to
securely reach agreement
about a shared secret that
can be used as a secret key
for subsequent symmetric
encryption of messages

Limited to the exchange of
the keys

**Digital
Signature
Standard (DSS)**

Provides only a digital
signature function with
SHA-1

Cannot be used for
encryption or key exchange

**Elliptic curve
cryptography
(ECC)**

Security like RSA, but with
much smaller keys

Digital Signatures

- NIST defines a digital signature as:
"The result of a cryptographic transformation of data that, when properly implemented, provides a mechanism for verifying origin authentication, data integrity and signatory non-repudiation."
<https://powcoder.com>
- Thus, a digital signature is a data-dependent bit pattern, generated by an agent as a function of a file, message, or other form of data block
- three digital signature algorithms:
 - Digital Signature Algorithm (DSA)
 - RSA Digital Signature Algorithm
 - Elliptic Curve Digital Signature Algorithm (ECDSA)

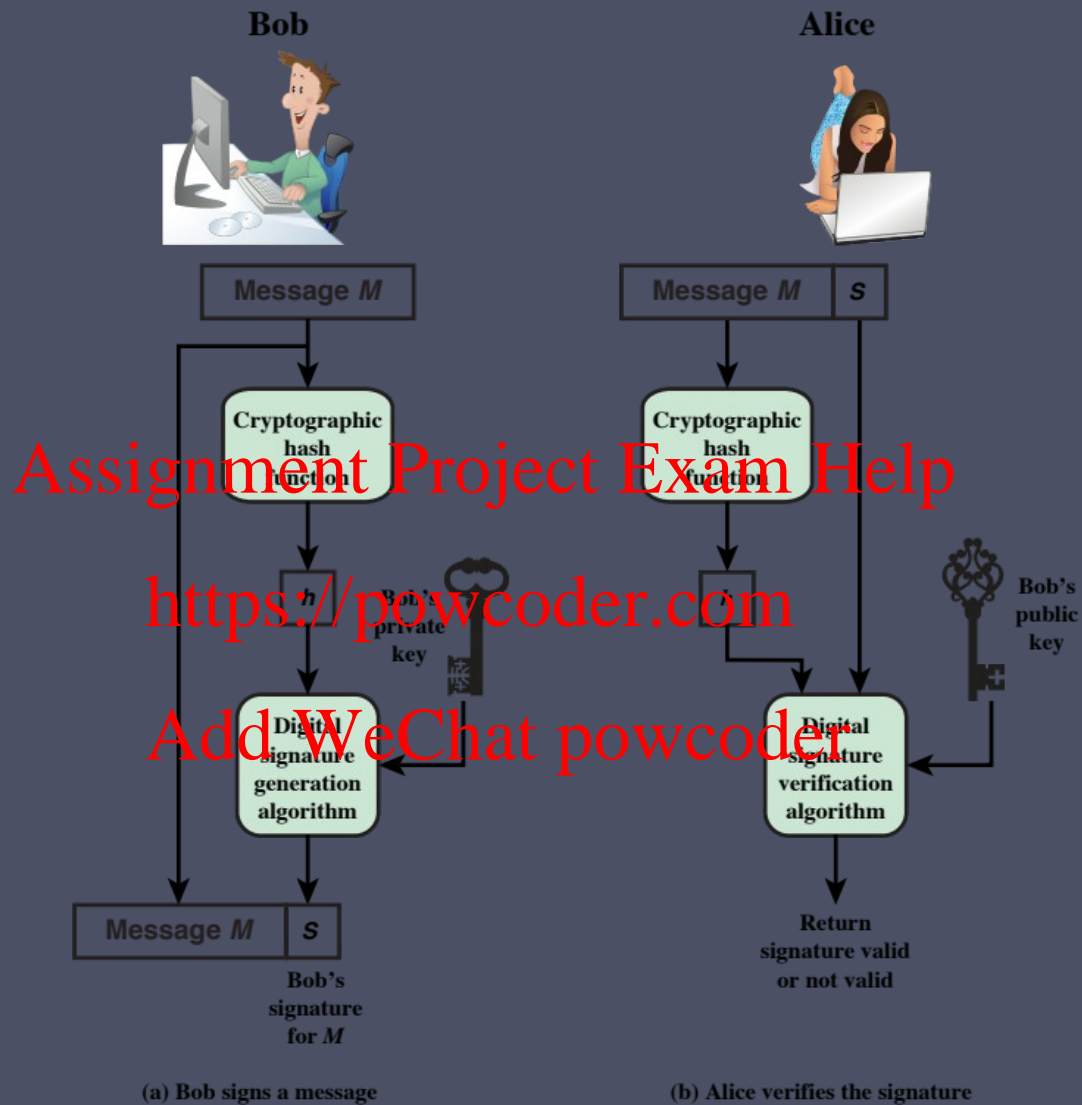

Figure 2.7 Simplified Depiction of Essential Elements of Digital Signature Process

Man-in-the-Middle Attack

- Attack is:
 1. Darth generates private keys X_{D1} and X_{D2} , and their public keys Y_{D1} and Y_{D2}
 2. Alice transmits Y_A to Bob
 3. Darth intercepts Y_A and transmits Y_{D1} to Bob. Darth also calculates $K2$
 4. Bob receives Y_{D1} and calculates $K1$
 5. Bob transmits X_A to Alice
 6. Darth intercepts X_A and transmits Y_{D2} to Alice. Darth calculates $K1$
 7. Alice receives Y_{D2} and calculates $K2$
- All subsequent communications compromised

Digital Certificate

- A digital certificate is an electronic permit that allows a person, organization or a computer to exchange the information securely over the Internet by using the public key infrastructure (PKI).
Assignment Project Exam Help
- Digital certificates help establish the identity of people or electronic assets.
<https://powcoder.com>
Add WeChat powcoder
- They protect online transactions by providing secure, encrypted, online communication.

Digital Certificate

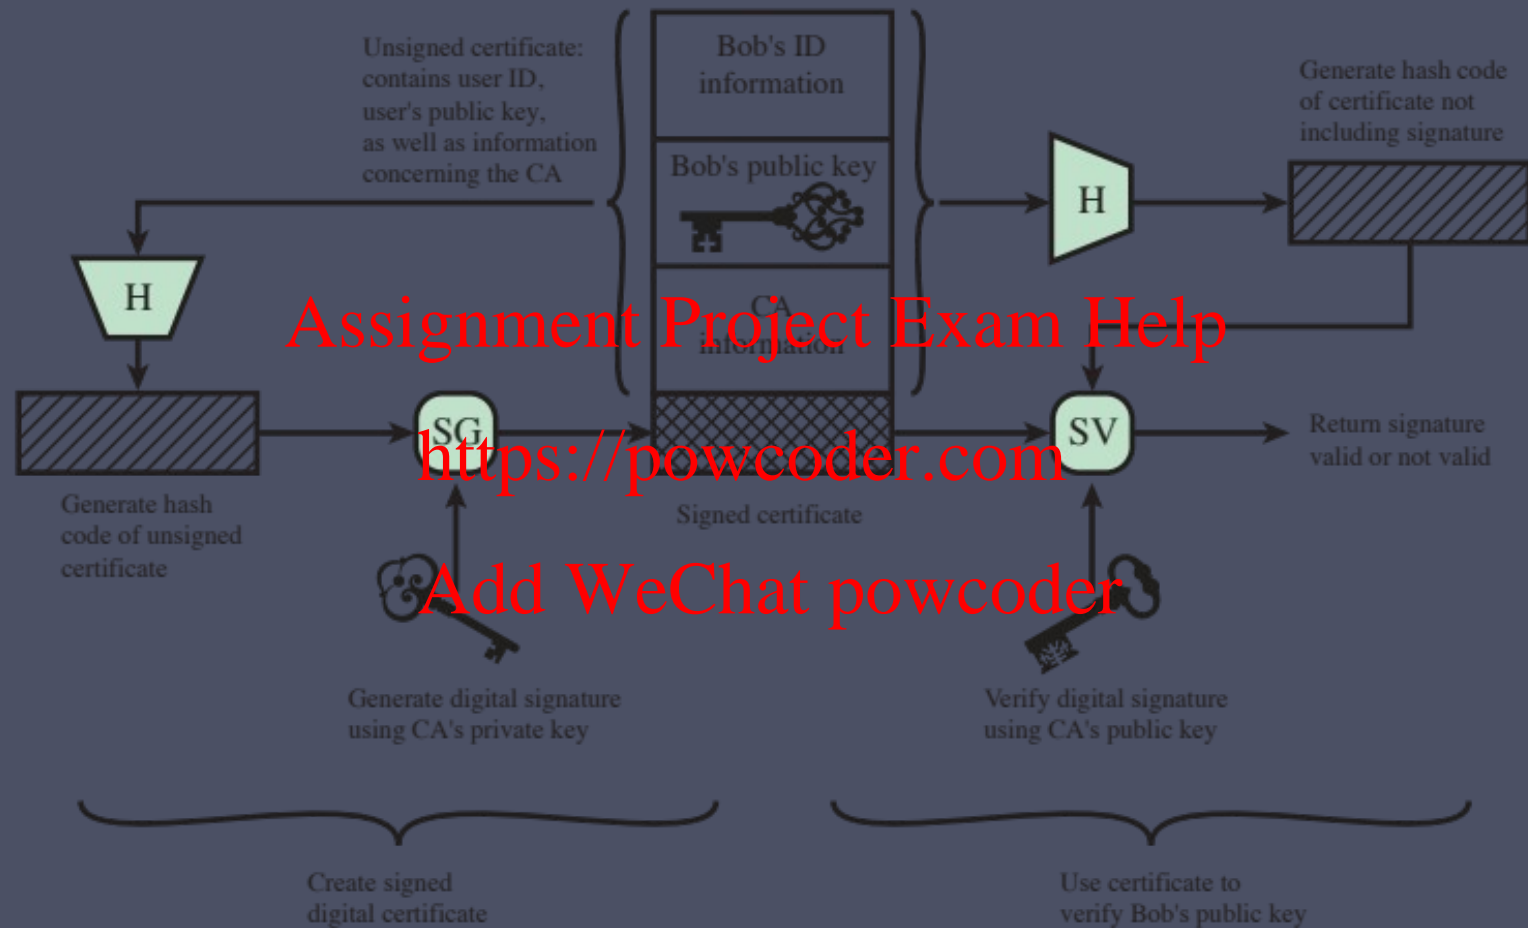

Figure 2.8 Public-Key Certificate Use

Types of digital certificates

SSL certificates

- 1) Server Certificates : SSL certificate authenticates the server to web browsers
- 2) Organization Certificates : self-signed certificates

Codesigning certificates

- 3) Personal Certificates
- 4) Developer Certificates

- “A Code Signing Certificate authenticates the identity of a software developer or publisher and provides assurance that the signed piece of software has not been altered or tampered with. This is done by applying a digital signature and hashing it along with the software itself.”
- a user attempts to download a piece of unsigned software the browser or antivirus program they're running will flag it

Public Key Infrastructure - PKI

- Framework for managing digital certificates and public key encryption
- Facilitate the secure electronic transfer of information over the Internet – transactions, sending/receiving personal details etc
- Consists of policies and standards → Ultimate goal is to build trust

Add WeChat powcoder

Trust

- Trust: Multi-facet complex concept
- Trust: Confidence, Benevolence, Reliance
My research on trust – [link](#)
- Frauds in e-commerce: Trust, Identify and Chargeback etc
<https://powcoder.com>
Add WeChat powcoder
- Interpersonal – direct trust between two
- External – Third party trust
I trust John, you trust John
I trust you

CA

- Certificate Authority
- Certificate Authority or certification authority (CA) is an entity that issues digital certificate. A digital certificate certifies the ownership of a public key by the named subject of the certificate.
<https://powcoder.com>
Add WeChat powcoder
- Ensure trust in e-commerce
- Internal to organisation – self signed certificate
- External - Verisign and GlobalSign are most popular Cas

SSL/TLS

SSL (Secure Sockets Layer) is a standard security technology for establishing an encrypted link between a server and a client

SSL allows sensitive information such as credit card numbers, social security numbers, and login credentials to be transmitted securely.

More specifically, SSL is a security protocol.

“**SSL Certificates** are small data files that digitally bind a cryptographic key to an organization's details. When installed on a web server, it activates the padlock and the https protocol and allows secure connections from a web server to a browser” GlobalSign

(b) Opening a digital envelope

Figure 2.9 Digital Envelopes

Practical Application: Encryption of Stored Data

Common to encrypt transmitted data

Assignment Project Exam Help

<https://powcoder.com>

Much less common for stored data

Add WeChat powcoder

There is often little protection beyond domain authentication and operating system access controls

Data are archived for indefinite periods

Even though erased, until disk sectors are reused data are recoverable

Approaches to encrypt stored data:

Use a commercially available encryption package

Back-end appliance

Library based tape encryption

Background laptop/PC data encryption

Elliptic Curve

- Proposed in 1985 by Neal Koblitz and Victor Miller
- Public key cryptography just like RSA
- User has two pairs of keys
- Discrete logarithm on elliptic curve is more difficult

$y = \text{mod } p$ **Assignment Project Exam Help**

<https://powcoder.com>

Challenge : Given y , g and p (g and p very large)

it is not VERY EASY (impossible) to calculate x .

- All public-key cryptosystems have some underlying mathematical operation.
 - RSA has exponentiation (raising the message or ciphertext to the public or private values)
 - ECC has point multiplication (repeated addition of two points).

ELLIPTIC Curve

Consider elliptic curve

$$E : y^2 = x^3 - x + 1$$

- If P_1 and P_2 are on E , we can define $R = P_1 + P_2$ as shown in picture

- Addition is all we need

Modulo arithmetic: cycle of numbers around, in ECC it use points

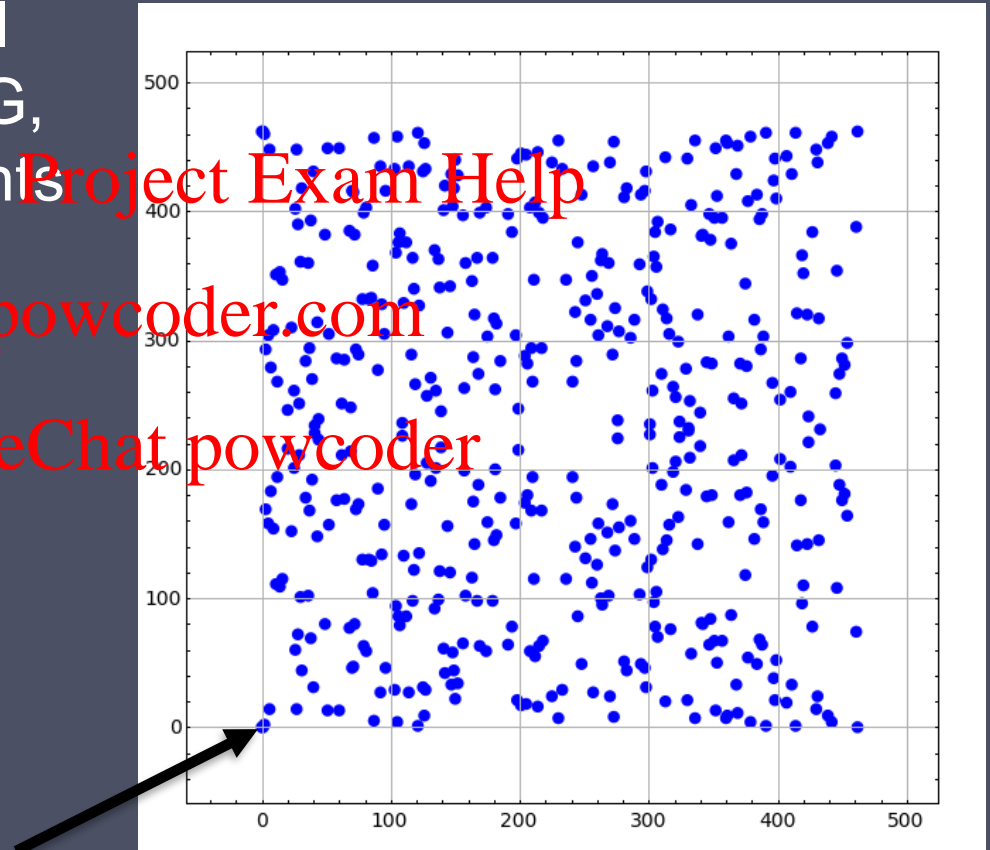

mod n was used in DH which used exponentiation

In ECC it is simply add a point to the, suppose g is our initial point, further points will be $2G$, $3G$, $4G$ These will be points somewhere on the curve

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

?G how many multiple points of g is this point
impossible to extract that information – private number

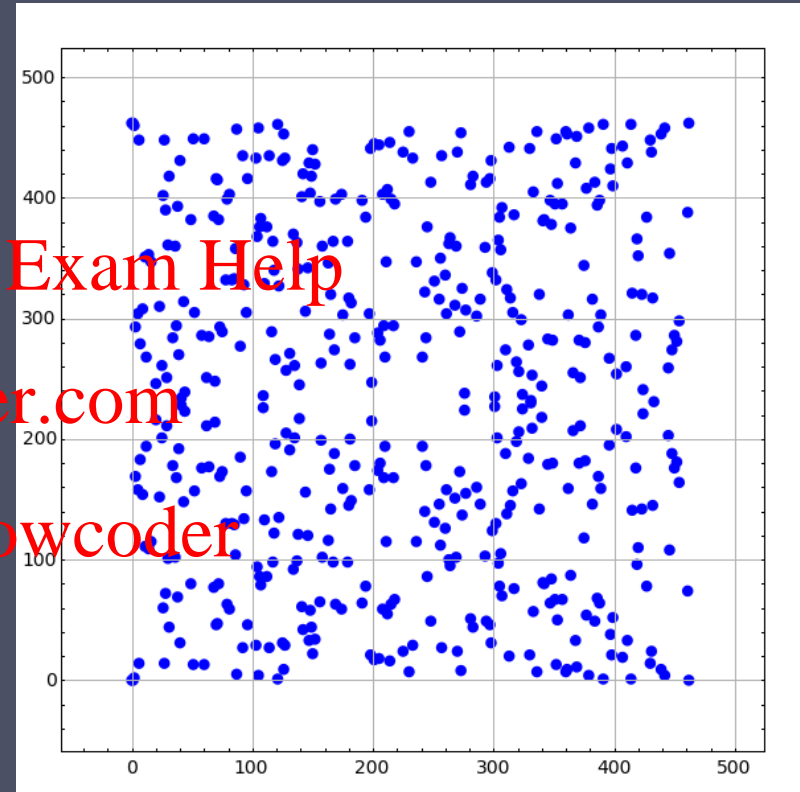

Elliptic Curve

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Pick a point on the elliptic curve (G).

Generate a random number (n)

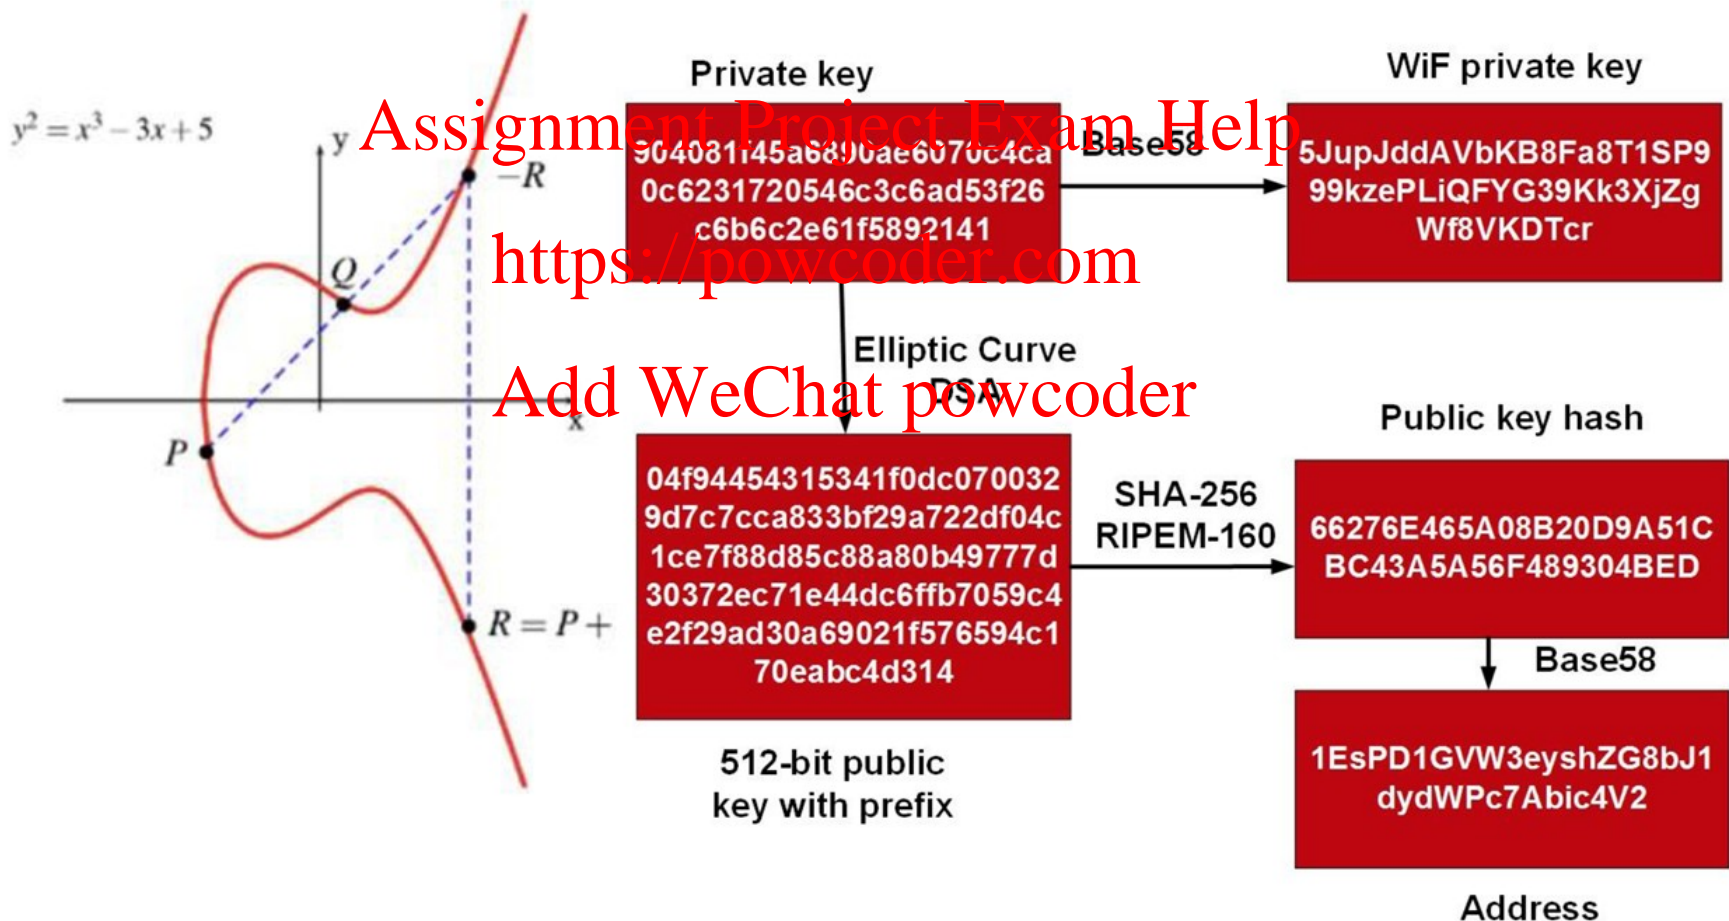

— this will be the private key.

Public key is $P = n \times G$

Bitcoin, IoT and Tor

Elliptic curve

Bitcoin Key Generation

Tor

Tor network use Elliptic curve

Applications

Wireless communication devices

- Smart cards
- Web servers that need to handle many encryption sessions
- Any application where security is needed but lacks the power, storage and computational power that is necessary for our current cryptosystems
